About the FloridaCHARTS.com Death Query System
The Death Count and Death Rate Query Systems provide counts and rates of deaths from 1970 to the present. Data are final unless marked as provisional. Provisional data are updated weekly.

In these query systems, causes of death are provided for the international standard diagnostic cause groups (see World Health Organization http://www.who.int/classifications/icd/en/) which are used to classify diseases and record many types of health and vital records including death certificates. Periodically these classifications are revised to include additional causes of death. By clicking the + beside each group, they can be further expanded into additional cause groups. Each cause also includes the corresponding ICD code number(s). For example, Anemias (D50-D64). For more information, consult the National Center for Health Statistics: http://www.cdc.gov/nchs/data/dvs/Part9InstructionManual2009.pdf.

The listing of variables below provides descriptions of the variables as well as notes where data classifications or data availability changes. Variables are presented in both the counts and rates query system unless otherwise noted.

Interpretation notes:
1. In this system, if there are no values for the variable selected, then no data will be displayed.
2. For selected causes of death (HIV and suicide) and combinations of death including these causes, only county-level geography is available.
3. Starting with 2003 deaths, the sum of the deaths from all counties will not equal the total number of resident deaths due to an unknown county of residence on some records.
4. Data marked as provisional is subject to change.

Maternal death reports are available by selecting “Maternal Death Counts by Year” in the Standard Reports section of the Death Counts Query System or “Maternal Death Ratio per 100,000 Births by Year” in the Death Rates Query System. Maternal deaths are defined as deaths to females in 1970-1978 using ICD8 630-678; in 1979-1998 using ICD9 630-676; in 1999-present using ICD10 A34, O00-O95,O98-O99.

</tbody>
</table>

YPLL is an estimate of premature mortality that has been defined as the number of years of life lost among persons who die before a predetermined age. In the case of FloridaCHARTS.com, that age is 75. This YPLL rate is calculated in the following manner:

1. Calculate (75 – age at death) for all deaths that occurred for a specific cause in a certain county

2. Add the results of this calculation and calculate a rate per 100,000 population under 75 (A YPLL rate is a type of crude rate).

NOTE: Deaths that occur at age 75 or greater are excluded from this calculation.

Age-adjusted death rates control for differences between populations due to age. For example, a county with a younger population may be expected to have fewer cardiovascular disease deaths than a county with an older population. Comparing these counties using age adjusted death rates will adjust for this difference. Age adjusted rates are calculated using the Year 2000 Standard Population Proportion. Population estimates are provided by the Florida Legislature, Office of Economic and Demographic Research.

Crude death rates are usually expressed per 1,000 or per 100,000. Crude death rates are calculated by dividing the number of deaths by the estimated mid-year population, then multiplying by 1,000 (or by 100,000).
Cause of Death Classifications

The underlying cause of death is determined from death certificate medical information in accordance with procedures established by the World Health Organization (WHO) and the National Center for Health Statistics (NCHS). Standardized codes are assigned from the International Classification of Diseases (ICD). To keep abreast of changes in medical knowledge, the ICD is revised approximately every 10 to 15 years. Revisions and years used in Florida are:

<table>
<thead>
<tr>
<th>Revision</th>
<th>Years Used</th>
<th>Revision</th>
<th>Years Used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Second</td>
<td>1917-1920</td>
<td>Seventh</td>

<tr>
<td>Third</td>
<td>1921-1929</td>
<td>Eighth</td>
<td>1968-1978</td>
</tr>
<tr>
<td>Fourth</td>
<td>1930-1940</td>
<td>Ninth</td>
<td>1979-1998</td>
</tr>
<tr>

<td>Tenth</td>
<td>1999-Present</td>
</tr>
<tr>
<td>Sixth</td>
<td>1949-1957</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Due to these revisions, some of which involve major changes, year-to-year comparisons of deaths by cause can be misleading, unless such comparisons span a period of years in which only one revision was used, or in which the changes from one revision to another were minor. The Tenth Revision contains major modifications in many sections. Under the Tenth Revision, a disease category such as "pneumonia/influenza" may be redefined so that more or fewer deaths are included in that classification. To permit more accurate comparisons, NCHS coded a sample of 1996 US deaths by both the Ninth and Tenth Revision rules. The results were grouped by major causes and, for each of these; the number of Tenth Revision deaths was divided by the number of Ninth Revision deaths to produce a comparability ratio. For example, the comparability ratio for Malignant Neoplasm is 1.0068. This means the Tenth Revision coding of 10,000 death certificates will produce about 68 more Malignant Neoplasms than the Ninth Revision coding would. The comparability ratios for 113 selected causes of death and the 130 selected causes of infant death may be found in the National Vital Statistics Report, Vol. 49, No. 2, May 18, 2001 available at http://www.cdc.gov/nchs/data/nvsr/nvsr49/nvsr49_02.pdf.
